

Machine Assessment

Our machine-check programme for you

- we check the safety of your machine
- we provide you with a machine assessment
- we determine the quality standard of your machine

Range of application

If your balancing machine has been in reliable service for years, or perhaps has been standing around unused in your works for a long time, and you now want to bring it back into operation quickly, this is no problem for you: our service team can assist you with checking your system. Our service technicians will tell you precisely what condition your machine is in, check the safety of the system and provide you with a checklist. If you have decided to sell your balancing system, or are about to decide whether to buy a used machine, we will provide you with a machine assessment and establish the residual value of the machine. This assessment will be carried out by the qualified experts of our service team, and can also serve as the basis for modernisation or conversion of the machine.

We determine the quality standard of your machine or system by means of traceable measurement procedures developed in-house, which also include the determination of the measurement system capability. That means that we tell you how well and accurately your measurement equipment is working. We provide you with an answer to the question of whether you can continue working with the current configuration of the measurement equipment, or whether modernisation is advisable.
